Productive Functions of Forests

Increments in European forests substantially exceed fellings

Forests in Europe are growing at a high rate. In all European regions, net annual increment exceeds fellings. In Central-Western Europe, fellings were higher than in all other regions due to catastrophic events, mainly storms. Harvesting of wood has decreased in Europe since the previous reporting period.

Europe remains one of the largest producers of roundwood in the world

The overall value of marketed roundwood reached more than €18,000 million in 2010 and is still increasing. Europe's forests are still one of the main sources of roundwood in the world. The reported roundwood value by unit is highly variable among reporting countries. The demand for woodfuel is increasing at a high rate, especially in some Western European countries.

The total value of marketed non-wood goods reported was almost €2.3 billion

73% of the total value generated by non-wood goods comes from marketed plant products. The importance of various non-wood goods differs among countries. They can be an important source of income, especially at the local level.

The most relevant services reported are biospheric and social services.

The total reported value for marketed services is around €619 million

Biospheric and social services dominate in the reported data. Bearing in mind the relatively low number of responding countries, the total reported value for marketed services was around €619 million, which represents a further decrease in comparison with the €818 million reported in 2011 and the €941 million reported in 2007. Due to the incompleteness

Even if data on marketed services are very limited, it is clear that they represent a **non-negligible income for forest owners.**
